Section 8.1: Prioritisation of the three review pairs

Mobile Money Investigations, September 2026 data (20,003,300 transfers). Draft prepared 24 October 2026. All figures come from the saved results of the 61-case comparison (Q1 to Q7, sets A to F); times are CAT (Africa/Kigali).

1. Evidence by pair

In each pair the first set is the pattern account and the second is a control with the same device and network shape.

Pair (review accounts)	Q3 shared devices (accounts / devices)	Q4 reach, k=4 to k=10	Q5 rapid chain	Q6 cycle	Q7 length (bound 4 / 6)	Q1 outgoing in the hour
A 998 vs **D** 237998	4 / 2 vs 4 / 2	10 to 187 vs 10 to 192	A: 1 chain, 200,000 to 196,000 to 192,080 RWF. D: none	A: 1 cycle, 4 transfers. D: none	3 / 3 vs 3 / 3	200,000 vs 45,000 RWF
B 147228 vs **E** 144228	9 / 2 vs 9 / 2	46 to 228 vs 47 to 230	B: 1 chain, 1,050,000 to 1,029,000 to 1,008,420 RWF. E: none	none vs none	no path / 5 vs no path / 5	1,050,000 vs 40,000 RWF
C 206978 vs **F** 203978	9 / 2 vs 9 / 2	146 to 1,433 vs 147 to 1,426	C: 1 chain, 300,000 to 294,000 to 288,120 RWF. F: none	C: 1 cycle, 6 transfers. F: none	no path / 5 vs no path / 5	300,000 vs 30,000 RWF

Key observation. Within every pair, Q3, Q4 and Q7 are almost identical (for example Q4 at k=10: 187 vs 192, 228 vs 230, 1,433 vs 1,426). Shared devices, network reach and shortest connection therefore do not separate the pattern account from its control. Only Q5 (rapid onward chain), Q6 (cycle) and the Q1 amount differ, so the ranking below rests on those.

2. Review order

Rank	Account	Why	What would change the rank
1	**C: 206978**	Chain and a cycle that returns to the origin (6 transfers, 08 Sep 10:00:42 to 10:04:02), the largest loop (5 other accounts) and 300,000 RWF. All 5 other loop accounts share handset 228043 with 206978 (confirmed from the full Q3 rows). Its control F has the same network but no chain, no cycle and 30,000 RWF.	The device link is complete in both C (5 of 5 loop accounts) and A (3 of 3), so it does not decide between them. A would move first only if speed alone were ranked (4 transfers in 120 s against 6 in 200 s) or if value were ignored.
2	**A: 998**	Chain and a closed 4-transfer cycle within 120 s (200,000 RWF). All three other loop accounts (8917, 16836, 24755) share handset 228001 with 998.	Smaller value and a shorter loop than C, with the same completeness of device link.
3	**B: 147228**	Largest single amount (1,050,000 RWF, 3.5 times C) and a rapid chain, but no cycle, so the funds do not return to the origin.	If review is ranked by value at risk alone, B moves to first. State the rule used.

This is a review priority, not a finding of fraud. The data cannot show intent.

3. Detailed pair: C (206978) against F (203978)

Transfer	From	To	Amount (RWF)	Time (CAT)	Role
20000229	206978	214897	300,000	08 Sep 10:00:42	Q5 and Q6, step 1
20000230	214897	222816	294,000	08 Sep 10:01:22	Q5 and Q6, step 2
20000231	222816	230735	288,120	08 Sep 10:02:02	Q5 and Q6, step 3 (end of the 3-transfer chain)
20000232	230735	238654	282,357	08 Sep 10:02:42	Q6, step 4
20000233	238654	6573	276,710	08 Sep 10:03:22	Q6, step 5
20000234	6573	206978	271,176	08 Sep 10:04:02	Q6, step 6 (returns to the origin)

Pattern. A transfer every 40 seconds, each amount 98% of the previous one; 271,176 of 300,000 RWF (90.4%) returns to the origin after 3 minutes 20 seconds. The first transfer falls inside the review hour (09:45 to 10:45 CAT).

Device evidence (Q3, all nine rows for 206978). The five other accounts in the loop (214897, 222816, 230735, 238654, 6573) all share handset 228043 with 206978 from day 0 to day 29 of the data window. A second device, 206976, is shared with 206976, 206977, 206979 and 206980; these four are not in the loop, and the overlap with 206976 starts on day 11.

Other account	Device	Type	Overlap days	In the loop?
214897	228043	handset	0 to 29	yes
222816	228043	handset	0 to 29	yes
230735	228043	handset	0 to 29	yes
238654	228043	handset	0 to 29	yes
6573	228043	handset	0 to 29	yes
206976	206976	handset	11 to 29	no
206977	206976	handset	0 to 29	no
206979	206976	handset	0 to 29	no
206980	206976	handset	0 to 29	no

Control. F (203978) has the same device shape: accounts 3573, 211897, 219816, 227735 and 235654 share device 228343, and accounts 203976, 203977, 203979 and 203980 share device 203976 (overlap from day 11 for 203976). Its network is similar (Q4 1,426 vs 1,433) and Q7 is the same, but there is no chain, no cycle and only 30,000 RWF outgoing in the hour. A shared device alone is therefore not what marks C out.

4. Ordinary explanation for the association

Each amount is exactly 98% of the previous one, which is consistent with a flat 2% deduction (a fee or commission) at every hop. An ordinary reading is a payment passed through intermediaries, such as agents rebalancing float or a household or small business moving money between members' wallets, with the last transfer returning a refund or settlement to the origin. Shared devices could be a family handset or a shop phone. This is an explanation to be tested, not a conclusion.

5. Missing evidence and how it could change the judgement

Missing evidence	Effect on the judgement
Fee or commission schedule	If a 2% charge per transfer is standard, the decline in amounts is expected and the concern falls.
Owners of the loop accounts (one customer or several)	Transfers between one customer's own accounts would be ordinary; unrelated owners would raise the priority.
Purpose and history before September	A regular monthly settlement would lower the concern; a first-time burst would raise it.
Device type, location and usage times	One handset used by all loop accounts at the same time would strengthen the link; a shared household handset would weaken it.
Source of the 300,000 RWF	Cash-in at an agent versus an incoming transfer changes whether the loop is the start or a middle of a longer flow.

6. Status of this draft

Q3 device rows are now confirmed from the corrected evidence run (columns: other account, device, device type, overlap start day, overlap end day). To add before submission: the chain or cycle diagram for C, the ownership-device diagram, and the screenshots with the taskbar and clock visible.
